PREFACE

This book is one volume of a set of seven books presenting statistics on hospital stay during 1986 in the United States. The complete set is the latest in a series of publications on length of stay in hospitals that participate in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities. Data from several organizations contributing to CPHA from other abstracting services are included in the 1986 series.

These statistics, also available on computer-readable tape, provide a valuable perspective for physicians, administrators, utilization review professionals, and hospital planners interested in cost containment and quality care.

CPHA wishes to extend appreciation to the hospitals and state organizations that supported this publication by making their data available.

ABOUT CPHA

The Commission on Professional and Hospital Activities (CPHA) is an organization dedicated to the improvement of hospital and medical care through research, education, publishing, and systems development. Established in 1955 under grants from the W.K. Kellogg Foundation, CPHA is a nonprofit, private organization, sponsored by the American College of Physicians, the American College of Surgeons, the American Hospital Association, and the Southwestern Michigan Hospital Council.

CPHA Publications, a unit of the Research Department, is responsible for the development of issue-oriented data reference tools setting performance guidelines and comparative standards for the health care industry. CPHA Publications disseminates important research findings to support and enhance the day to day activity of health care professionals in a variety of settings.

DISCUSSION OF THE DATA

Source of the Data

Data in the Length of Stay books were compiled from individual patient discharge records submitted to CPHA by hospitals participating in the Professional Activity Study (PAS). In addition, some books contain discharge data from hospitals participating in information systems other than PAS.

The following steps describe the PAS method of storing and retrieving medical data:

1. In each participating hospital, personnel transfer data from the medical record of each discharged patient into the PAS System via PAS+ micro-computer, magnetic tape, or PAS Case Abstract.
2. The disk, tape, or abstract, is mailed to the center of PAS operations in Ann Arbor, Michigan, where it is entered into the computer system.
3. Data undergo a comprehensive editing process and errors are corrected by CPHA and contributing hospitals.
4. The computer system continually adds data to a permanent file. Participating hospitals are provided access to these data through interactive systems, in-house computers, and reports. The stored data are also available to researchers on a contractual basis.
5. Data are standardized to create an aggregated patient record base.

Annually, CPHA Publications uses these data to create the Length of Stay (LOS) series and other reference tools.

Data Quality

Data quality is one of the primary concerns of CPHA. Although the hospital has basic responsibility for the quality of PAS data, CPHA shares that responsibility in its function as an extension of the hospital's medical information network.

CPHA exerts considerable effort to prevent and correct errors in data submitted. Hospital medical records personnel are trained by CPHA in coding and abstracting methods. CPHA monitors submitted data, and meticulously checks and edits the data for errors. Over 600 computer checks are performed during the processing of each record to ensure the reasonableness of the data received. Examples of discrepancies detected by the audit are: hospital day of operative episode exceeding total stay, cesarean section with a normal delivery diagnosis, sex-specific diagnosis or operation with the wrong sex recorded, incalculable age or stay, unrecorded or invalid diagnosis. When illogical, invalid, or missing data are detected, about 40 percent of the errors are corrected by computer. The remainder are referred back to the hospital staff through computer-generated error messages.

In addition to initial data editing, the computer system that produces the length of stay tables does numerous edits to eliminate uncorrected or unusual data. The following events cause a record to be excluded as not representing a typical short-term patient:

1. death
2. stillborn
3. admission from other short-term hospital
4. discharge to other short-term hospital
5. discharge against medical advice

Geographic Coverage

Data chosen for inclusion in the Length of Stay series are from general, nonfederal, short-term hospitals in the United States. Short-term hospitals are defined as those in which the median stay is shorter than 30 days. The map indicates the boundaries of each regional book.

Most of the data used in the Length of Stay books are from hospitals participating in PAS through CPHA. In addition, the following organizations have sent data to CPHA: Alabama Hospital Association, Colorado Hospital Association, Kaiser Foundation Hospitals, Kansas Hospital Association, Maine Hospital Association, Missouri Health Data Corporation, The National Association of Children's Hospitals and Related Institutions, Inc. (NACHRI), Oregon Hospital Association, Sisters of Mercy Health Corporation (SMHC), Utilization Information Service of the Hospital Association of New York State, and the Vermont Hospital Association. Several individual hospitals throughout the United States have also sent data to CPHA for special studies. These additional data expand CPHA as a national health information center. The cooperation of these organizations is appreciated.

Hospitals participating in PAS from United States Territories and Puerto Rico are excluded from the series. Data from psychiatric hospitals are excluded because these facilities are not general hospitals. Data from psychiatric units within general hospitals are included. Pediatric hospitals are also included.

Characteristics of all hospitals with data included in the Length of Stay books are displayed on the following page.

Organization of Length of Stay Tables

The length of stay tables are organized according to CPHA's cross-clasification, a patient classification system similar to Diagnosis Related Groups (DRGs). The Diagnosis classification system is called *ICD-9-CM List A: Hospital Diagnosis Groups*.[1] Within each procedure group, patients are further stratified by single or multiple diagnoses and age. For diagnosis groups 393-395, which pertain exclusively to newborn, age is replaced by birth weight in grams. The Operation classification system is called *ICD-9-CM List B: Hospital Procedure Groups*. Within each procedure group patients are further stratified by single or multiple diagnoses and age.

Patient Data Assignment:

Patient data are assigned an *ICD-9-CM List A* group on the basis of the principal diagnosis. This is the diagnosis that after study explains why the patient was admitted to the hospital. Patient data are assigned *ICD-9-CM List B* groups on the basis of the principal procedure. "Principal procedure" is an item in the *Uniform Hospital Discharge Data Set (UHDDS)*[2] and generally is that therapeutic procedure most related to the principal diagnosis. Diagnosis and procedure information for all patient data included in this book was coded using *ICD-9-CM*. New *ICD-9-CM* codes, introduced in October 1986, are reflected in the indexes at the back of the book and in data submitted from hospitals.

Definition of Multiple Diagnoses Patients:

Patients are classified in the multiple diagnoses category if they had at least one valid secondary diagnosis in addition to the principal one. The following codes are not considered valid secondary diagnoses for purposes of this classification:

1) Manifestation codes (conditions that evolved from underlying diseases [etiology] and are in italics in *ICD-9-CM Volume 1*[3])
2) Codes V27.0-V27.9 (outcome of delivery)
3) E codes (external causes of injury and poisoning)

Definition of Operated Patients:

In the diagnosis tables, operated patients are patients who had at least one *UHDDS* Class 1 procedure. Patients with only Class 2-4 procedures are considered nonoperated. In the procedure tables, operated patients are those whose principal procedure fell into an *ICD-9-CM List B* group where at least one *UHDDS* Class 1 procedure was present. While most *List B* groups contain only Class 1 procedures, the following groups contain Class 1 procedures, and at least one procedure that is Class 2-4: 548, 557, 575, 576, 581, 587, 609, 615, 619, 626, 630, 636, 646, 654, 666, 679, 682, 686, 690, 696, 706, 758, 760, 764.

Explanation of Statistics

The *List A* diagnosis group titles and *List B* procedure group titles heading the tables are followed in parentheses by the *ICD-9-CM* diagnosis or procedure codes included in that *List A* or *List B* group.

Data are categorized by total patients (column 2), their average length of stay (column 3), the variance (column 4), and distribution percentiles (column 5 through 11). Patients are stratified by single or multiple diagnoses (dx), operation status, and age.

The computer calculates length of stay from admission and discharge dates by counting the day of admission but not the day of discharge. Patients discharged on the day of admission are counted as staying one day in the calculation of average stay and variance but as staying less than one day in the calculation of the percentiles. Thus, if more than 5 percent of the patients in a cell were discharged on the day of admission, the 5th percentile is shown as "<1."

A length of stay percentile for a group of patients is determined by arranging the individual patient stays from low to high. Counting up from the lowest stay to the point where half of the patients have been counted yields the value of the 50th percentile. Counting off one-tenth of the total patients gives the 10th percentile, and so on.

[1] *ICD-9-CM List A: Hospital Diagnosis Groups* and *ICD-9-CM List B: Hospital Procedure Groups* are based on the *International Classification of Diseases, 9th Revison, Clinical Modification (ICD-9-CM)*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

[2] Additional information regarding UHDDS principal procedure and classes of procedures can be obtained from *UHDDS Classes of Procedures, ICD-9-CM*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

[3] *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM), Volume 1, Diseases: Tabular List*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

The 5th, 10th, 50th, 75th, 95th and 99th percentiles of stay are displayed in days. If, for example, the 10th percentile for a group of patients is four, it means that 10 percent of the patients stayed four days or less. The 50th percentile is the median. Any percentile with a value of 100 days or more is listed as 99+.

Patients who were hospitalized 100 days or longer are not included in Total Patients, Average Stay, or Variance categories. However, the percentiles shown do include these patients.

The variance is a measure of the spread of the data around the average. For these tables, the smallest variance is zero, indicating all lengths of stay are equal. The maximum value for the variance is 2500.

When using operation tables in which there is a large variance, and the patient group size is relatively small, the reader might note that the average stay appears high. In most cases this occurs when one or two patients with long hospitalizations fall into the multiple diagnoses group. For example, the length of stay for an amniocentesis procedure might be unusually long when a patient has a psychiatric disorder as the principal diagnosis.

A further caution is suggested when using tables which group together a number of diagnoses, e.g., Table 328: Perinatal conditions causing morbidity and mortality, (incorporating *ICD-9-CM* codes 760-779), or procedures, e.g., Table 760: Special therapies and rehabilitation (93.0-93.9). In these groupings the length of stay may appear unnecessarily long or short for the situation being reviewed due to the inclusion of patient groups of varying severities.

Data in the Length of Stay (LOS) series are sequenced by the *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM)* code system. In the fall of 1986, the Health Care Financing Administration (HCFA) and the National Center for Health Statistics (NCHS) jointly announced the addition of new *ICD-9-CM* diagnosis and procedure codes effective for use with October 1986 discharges. The new codes were developed to accommodate coding of (1) acquired immune deficiency syndrome (AIDS) and related conditions; and (2) new procedures resulting from changes in technology.

The introduction of these codes affects data in the 1986 LOS in two ways:

(1) Totals for new codes reflect only three months of data (October-December 1986); thus new codes show low volumes in the 1986 edition.

(2) Totals for codes prior to the October 1986 changes show decreases in volume to the extent that new codes were used.

Application of Length of Stay Tables

The Length of Stay series can be used as a valuable reference source in a variety of health care settings. Use of stay data allows the health care professional to compare regional and national norms to their own institution or client. The LOS series assists in projecting extended stay reviews, while recommending the most effective use of patient care services. Norms from other editions of the LOS series create the opportunity to establish baselines as far back as 1964 to forecast and plan for future service demands.

The following steps are intended to provide a useful guide in situations where a health care professional wishes to determine a reasonable length of stay:

Step 1: Consult the index at the back of the appropriate Length of Stay book for the particular diagnosis or operation to be reviewed.

Step 2: Find the corresponding table in the Length of Stay book. The group number precedes the title of each table.

Step 3: Depending on the purpose of the review, find the appropriate portion of the table:

Single or Multiple Diagnoses
Not Operated or Operated (for Diagnosis groups only)
Patient's Age on Day of Admission

Step 4: Find the 50th percentile of stay for similar patients at the point where the 50th percentile column (7) of the table intersects the horizontal line containing the pertinent patient variables.

Step 5: Consult the total patient sample (Grand Total) and variance to consider the homogeneity of the data, i.e., to what extent length of stay averages are clustered or spread out within a particular patient group.

These general steps are followed, in more specific application, by health care professionals in many diverse settings. LOS tables can be used to identify candidates for utilization review, to furnish check points in patient care, to project extended stay reviews and to improve hospital care standards. Constantly increasing concern for quality care and cost containment make the Length of Stay tables an essential tool in the health care industry.

PREFACE

This book is one volume of a set of seven books presenting statistics on hospital stay during 1986 in the United States. The complete set is the latest in a series of publications on length of stay in hospitals that participate in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities. Data from several organizations contributing to CPHA from other abstracting services are included in the 1986 series.

These statistics, also available on computer-readable tape, provide a valuable perspective for physicians, administrators, utilization review professionals, and hospital planners interested in cost containment and quality care.

CPHA wishes to extend appreciation to the hospitals and state organizations that supported this publication by making their data available.

ABOUT CPHA

The Commission on Professional and Hospital Activities (CPHA) is an organization dedicated to the improvement of hospital and medical care through research, education, publishing, and systems development. Established in 1955 under grants from the W.K. Kellogg Foundation, CPHA is a nonprofit, private organization, sponsored by the American College of Physicians, the American College of Surgeons, the American Hospital Association, and the Southwestern Michigan Hospital Council.

CPHA Publications, a unit of the Research Department, is responsible for the development of issue-oriented data reference tools setting performance guidelines and comparative standards for the health care industry. CPHA Publications disseminates important research findings to support and enhance the day to day activity of health care professionals in a variety of settings.

DISCUSSION OF THE DATA

Source of the Data

Data in the Length of Stay books were compiled from individual patient discharge records submitted to CPHA by hospitals participating in the Professional Activity Study (PAS). In addition, some books contain discharge data from hospitals participating in information systems other than PAS.

The following steps describe the PAS method of storing and retrieving medical data:

1. In each participating hospital, personnel transfer data from the medical record of each discharged patient into the PAS System via PAS+ micro-computer, magnetic tape, or PAS Case Abstract.
2. The disk, tape, or abstract, is mailed to the center of PAS operations in Ann Arbor, Michigan, where it is entered into the computer system.
3. Data undergo a comprehensive editing process and errors are corrected by CPHA and contributing hospitals.
4. The computer system continually adds data to a permanent file. Participating hospitals are provided access to these data through interactive systems, in-house computers, and reports. The stored data are also available to researchers on a contractual basis.
5. Data are standardized to create an aggregated patient record base.

Annually, CPHA Publications uses these data to create the Length of Stay (LOS) series and other reference tools.

Data Quality

Data quality is one of the primary concerns of CPHA. Although the hospital has basic responsibility for the quality of PAS data, CPHA shares that responsibility in its function as an extension of the hospital's medical information network.

CPHA exerts considerable effort to prevent and correct errors in data submitted. Hospital medical records personnel are trained by CPHA in coding and abstracting methods. CPHA monitors submitted data, and meticulously checks and edits the data for errors. Over 600 computer checks are performed during the processing of each record to ensure the reasonableness of the data received. Examples of discrepancies detected by the audit are: hospital day of operative episode exceeding total stay, cesarean section with a normal delivery diagnosis, sex-specific diagnosis or operation with the wrong sex recorded, incalculable age or stay, unrecorded or invalid diagnosis. When illogical, invalid, or missing data are detected, about 40 percent of the errors are corrected by computer. The remainder are referred back to the hospital staff through computer-generated error messages.

In addition to initial data editing, the computer system that produces the length of stay tables does numerous edits to eliminate uncorrected or unusual data. The following events cause a record to be excluded as not representing a typical short-term patient:

1. death
2. stillborn
3. admission from other short-term hospital
4. discharge to other short-term hospital
5. discharge against medical advice

Geographic Coverage

Data chosen for inclusion in the Length of Stay series are from general, nonfederal, short-term hospitals in the United States. Short-term hospitals are defined as those in which the median stay is shorter than 30 days. The map indicates the boundaries of each regional book.

Most of the data used in the Length of Stay books are from hospitals participating in PAS through CPHA. In addition, the following organizations have sent data to CPHA: Alabama Hospital Association, Colorado Hospital Association, Kaiser Foundation Hospitals, Kansas Hospital Association, Maine Hospital Association, Missouri Health Data Corporation, The National Association of Children's Hospitals and Related Institutions, Inc. (NACHRI), Oregon Hospital Association, Sisters of Mercy Health Corporation (SMHC), Utilization Information Service of the Hospital Association of New York State, and the Vermont Hospital Association. Several individual hospitals throughout the United States have also sent data to CPHA for special studies. These additional data expand CPHA as a national health information center. The cooperation of these organizations is appreciated.

Hospitals participating in PAS from United States Territories and Puerto Rico are excluded from the series. Data from psychiatric hospitals are excluded because these facilities are not general hospitals. Data from psychiatric units within general hospitals are included. Pediatric hospitals are also included.

Characteristics of all hospitals with data included in the Length of Stay books are displayed on the following page.

Organization of Length of Stay Tables

The length of stay tables are organized according to CPHA's cross-clasification, a patient classification system similar to Diagnosis Related Groups (DRGs). The Diagnosis classification system is called *ICD-9-CM List A: Hospital Diagnosis Groups*.[1] Within each procedure group, patients are further stratified by single or multiple diagnoses and age. For diagnosis groups 393-395, which pertain exclusively to newborn, age is replaced by birth weight in grams. The Operation classification system is called *ICD-9-CM List B: Hospital Procedure Groups*. Within each procedure group patients are further stratified by single or multiple diagnoses and age.

Patient Data Assignment:

Patient data are assigned an *ICD-9-CM List A* group on the basis of the principal diagnosis. This is the diagnosis that after study explains why the patient was admitted to the hospital. Patient data are assigned *ICD-9-CM List B* groups on the basis of the principal procedure. "Principal procedure" is an item in the *Uniform Hospital Discharge Data Set (UHDDS)*[2] and generally is that therapeutic procedure most related to the principal diagnosis. Diagnosis and procedure information for all patient data included in this book was coded using *ICD-9-CM*. New *ICD-9-CM* codes, introduced in October 1986, are reflected in the indexes at the back of the book and in data submitted from hospitals.

Definition of Multiple Diagnoses Patients:

Patients are classified in the multiple diagnoses category if they had at least one valid secondary diagnosis in addition to the principal one. The following codes are not considered valid secondary diagnoses for purposes of this classification:

1) Manifestation codes (conditions that evolved from underlying diseases [etiology] and are in italics in *ICD-9-CM Volume 1*[3])
2) Codes V27.0-V27.9 (outcome of delivery)
3) E codes (external causes of injury and poisoning)

Definition of Operated Patients:

In the diagnosis tables, operated patients are patients who had at least one *UHDDS* Class 1 procedure. Patients with only Class 2-4 procedures are considered nonoperated. In the procedure tables, operated patients are those whose principal procedure fell into an *ICD-9-CM List B* group where at least one *UHDDS* Class 1 procedure was present. While most *List B* groups contain only Class 1 procedures, the following groups contain Class 1 procedures, and at least one procedure that is Class 2-4: 548, 557, 575, 576, 581, 587, 609, 615, 619, 626, 630, 636, 646, 654, 666, 679, 682, 686, 690, 696, 706, 758, 760, 764.

Explanation of Statistics

The *List A* diagnosis group titles and *List B* procedure group titles heading the tables are followed in parentheses by the *ICD-9-CM* diagnosis or procedure codes included in that *List A* or *List B* group.

Data are categorized by total patients (column 2), their average length of stay (column 3), the variance (column 4), and distribution percentiles (column 5 through 11). Patients are stratified by single or multiple diagnoses (dx), operation status, and age.

The computer calculates length of stay from admission and discharge dates by counting the day of admission but not the day of discharge. Patients discharged on the day of admission are counted as staying one day in the calculation of average stay and variance but as staying less than one day in the calculation of the percentiles. Thus, if more than 5 percent of the patients in a cell were discharged on the day of admission, the 5th percentile is shown as "<1."

A length of stay percentile for a group of patients is determined by arranging the individual patient stays from low to high. Counting up from the lowest stay to the point where half of the patients have been counted yields the value of the 50th percentile. Counting off one-tenth of the total patients gives the 10th percentile, and so on.

---

[1] *ICD-9-CM List A: Hospital Diagnosis Groups* and *ICD-9-CM List B: Hospital Procedure Groups* are based on the *International Classification of Diseases, 9th Revison, Clinical Modification (ICD-9-CM)*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

[2] Additional information regarding UHDDS principal procedure and classes of procedures can be obtained from *UHDDS Classes of Procedures, ICD-9-CM*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

[3] *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM), Volume 1, Diseases: Tabular List*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1978.

The 5th, 10th, 50th, 75th, 95th and 99th percentiles of stay are displayed in days. If, for example, the 10th percentile for a group of patients is four, it means that 10 percent of the patients stayed four days or less. The 50th percentile is the median. Any percentile with a value of 100 days or more is listed as 99+.

Patients who were hospitalized 100 days or longer are not included in Total Patients, Average Stay, or Variance categories. However, the percentiles shown do include these patients.

The variance is a measure of the spread of the data around the average. For these tables, the smallest variance is zero, indicating all lengths of stay are equal. The maximum value for the variance is 2500.

When using operation tables in which there is a large variance, and the patient group size is relatively small, the reader might note that the average stay appears high. In most cases this occurs when one or two patients with long hospitalizations fall into the multiple diagnoses group. For example, the length of stay for an amniocentesis procedure might be unusually long when a patient has a psychiatric disorder as the principal diagnosis.

A further caution is suggested when using tables which group together a number of diagnoses, e.g., Table 328: Perinatal conditions causing morbidity and mortality, (incorporating *ICD-9-CM* codes 760-779), or procedures, e.g., Table 760: Special therapies and rehabilitation (93.0-93.9). In these groupings the length of stay may appear unnecessarily long or short for the situation being reviewed due to the inclusion of patient groups of varying severities.

Data in the Length of Stay (LOS) series are sequenced by the *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM)* code system. In the fall of 1986, the Health Care Financing Administration (HCFA) and the National Center for Health Statistics (NCHS) jointly announced the addition of new *ICD-9-CM* diagnosis and procedure codes effective for use with October 1986 discharges. The new codes were developed to accommodate coding of (1) acquired immune deficiency syndrome (AIDS) and related conditions; and (2) new procedures resulting from changes in technology.

The introduction of these codes affects data in the 1986 LOS in two ways:

(1) Totals for new codes reflect only three months of data (October-December 1986); thus new codes show low volumes in the 1986 edition.

(2) Totals for codes prior to the October 1986 changes show decreases in volume to the extent that new codes were used.

Application of Length of Stay Tables

The Length of Stay series can be used as a valuable reference source in a variety of health care settings. Use of stay data allows the health care professional to compare regional and national norms to their own institution or client. The LOS series assists in projecting extended stay reviews, while recommending the most effective use of patient care services. Norms from other editions of the LOS series create the opportunity to establish baselines as far back as 1964 to forecast and plan for future service demands.

The following steps are intended to provide a useful guide in situations where a health care professional wishes to determine a reasonable length of stay:

Step 1: Consult the index at the back of the appropriate Length of Stay book for the particular diagnosis or operation to be reviewed.

Step 2: Find the corresponding table in the Length of Stay book. The group number precedes the title of each table.

Step 3: Depending on the purpose of the review, find the appropriate portion of the table:

Single or Multiple Diagnoses
Not Operated or Operated (for Diagnosis groups only)
Patient's Age on Day of Admission

Step 4: Find the 50th percentile of stay for similar patients at the point where the 50th percentile column (7) of the table intersects the horizontal line containing the pertinent patient variables.

Step 5: Consult the total patient sample (Grand Total) and variance to consider the homogeneity of the data, i.e., to what extent length of stay averages are clustered or spread out within a particular patient group.

These general steps are followed, in more specific application, by health care professionals in many diverse settings. LOS tables can be used to identify candidates for utilization review, to furnish check points in patient care, to project extended stay reviews and to improve hospital care standards. Constantly increasing concern for quality care and cost containment make the Length of Stay tables an essential tool in the health care industry.
